Fibracol

This is a foam-like dressing which contains collagen and alginate. The collagen is a protein which supports tissue and blood-vessel growth; the alginate helps manage the drainage from healing wounds.

Wound cleansing and fibracol application:

1. Prior to any wound care or dressing changes, take your pain medication as directed or at least 20 minutes prior to beginning wound care.
2. Cleanse area with tap water and a gentle soap as directed. We recommend using baby shampoo.
3. Cleanse off all excess Fibracol and any old wound drainage and buildup.
4. Apply Fibracol to the unhealed areas as directed by your doctor.
5. Cover with gauze or _______________ dressing and secure as directed.

Repeat wound care every other day.
